

SCMS

Business Design & Go-To-Market — Smart Campus Mobility System

Built for **Redemption City**, the RCCG camp ground on the Lagos–Ibadan Expressway (6.825889°N, 3.462819°E). This isn't a generic multi-campus pitch. SCMS is built around Redemption City's actual geography, zones, gates, and landmarks.

1 The Problem at Redemption City

Redemption City hosts some of the largest recurring religious gatherings anywhere, most notably the Holy Ghost Congress, which draws crowds in the hundreds of thousands across a camp ground spanning thousands of acres. At that scale, the same problems show up every event:

- **Visitors get lost.** There's no reliable way to navigate between gates, the Holy Ghost Auditorium, the Camp Food Court, the Medical Centre, or restrooms across grounds this large.
- **Drivers circle aimlessly.** Nobody can tell which of the camp's parking areas, Main Car Park, Guest House Parking, or Arena Overflow Parking, still has space, so vehicles back up at the gates while other zones sit half empty.
- **Wardens coordinate by radio.** Incidents and hazards get reported verbally, with no record of what happened, when, or who responded.
- **Camp administration flies blind.** There's no real-time view of zone occupancy or warden deployment across the ground during peak congestion.

2 Who This Is For

Redemption City itself, operated by The Redeemed Christian Church of God (RCCG). SCMS is modeled directly on the camp's real layout:

Element	Real examples already in the system
Parking zones	Main Car Park (P-A), Guest House Parking (P-B), Arena Overflow Parking (P-C)
Venue ground	Holy Ghost Auditorium Grounds (V-MAIN)
Gates	Main Entrance Gate, Eastern Exit Gate, VIP Gate
Landmarks	Holy Ghost Auditorium, Redemption City Medical Centre, Camp Food Court, Admin Secretariat, restroom blocks

The people who use it on the ground:

User	What SCMS gives them at Redemption City
Visitor at a Congress or service	An anonymous map to navigate gate to auditorium to food court to restroom, with no login needed
Driver arriving for a vigil or Congress	Live status of Main Car Park, Guest House Parking, and Arena Overflow Parking, with a route to whichever is open
Warden on duty	One tap zone status updates, instant alert broadcast (e.g. "Flooding near Gate 2, use Gate 1"), and incident logging

Camp administration

A real-time view of warden deployment and zone occupancy across the entire camp during peak events

3 Business Model

SCMS is built for Redemption City specifically, not as a multi-tenant SaaS product.

- **Commissioned directly by RCCG** as the operating body of Redemption City. Either a one-time build and handover, or an ongoing hosting and maintenance retainer tied to the camp's event calendar (Congress, Convention, weekly services).
- **Optional data insight package.** Anonymized occupancy and crowd-flow reports per event (for example, "Main Car Park fills by 9:40am on Congress days") to inform the camp's own future infrastructure decisions. There's no privacy cost since visitors never hold an account.
- **A future possibility, not the current plan.** If this proves out at Redemption City over time, the same approach could extend to other RCCG provincial camps. That's a downstream option, not part of this go-to-market.

4 Rollout Plan

Stage	Scope
Phase 1: Pilot	Deploy on the existing seeded zones, gates, and landmarks during a regular weekly service or a smaller convention. Validate the real-time flow with a small number of wardens before scaling up.
Phase 2: Flagship event	Once validated, roll out camp-wide for a major gathering such as the Holy Ghost Congress, with full warden deployment and the visitor map live for attendees.
Phase 3: Standing tool	SCMS becomes Redemption City's permanent operations layer for every event going forward, not a one-off pilot.

The primary stakeholder and decision-maker throughout is Redemption City's camp administration and RCCG event operations team.

5 What It Replaces

Today at Redemption City	With SCMS
Wardens coordinate by radio, with no record of incidents	Incidents and alerts are logged, timestamped, and broadcast instantly through the app
No visitor facing digital map of the camp	A live, anonymous map covering real zones, gates, and landmarks

No visibility into parking occupancy	Drivers see live zone status and get routed to the nearest available zone
Generic maps only show the camp's general location	SCMS understands the camp's internal layout, the zones, gates, and landmarks that no general purpose map covers

6 Roadmap

Stage	Scope
Now (hackathon MVP)	Auth, Redemption City's seeded campus map, parking zone status, alerts and incidents, and real-time WebSocket sync, all modeled on the camp's actual zones and landmarks
Next 3 months	Turn-by-turn navigation across the camp, push notifications for Congress-scale events, and an admin analytics dashboard for camp administration
6 to 12 months	Crowd prediction trained on real Redemption City event data, replacing today's distance and occupancy heuristic, plus integration with the camp's physical gate operations

7 Why Now

Redemption City's events keep growing in scale. The Holy Ghost Congress regularly draws record attendance year over year. Smartphone penetration among attendees is now high enough that a visitor facing app is a realistic channel, not a barrier. And safety at this scale of gathering is a real and growing concern for the camp. Real-time incident reporting and alerting moves operations from reactive radio coordination to a proactive, recorded response.
