

KINGDOM HACK 3.0 · SMART CITY INNOVATION TRACK

SCMS

Real-time navigation, parking, and safety for Redemption City

Built for Redemption City, the RCCG camp ground on the Lagos–Ibadan Expressway (6.825889°N, 3.462819°E). One app for visitors, drivers, wardens, and camp administration.

THE PROBLEM

Redemption City runs on radios and guesswork

At Holy Ghost Congress scale, hundreds of thousands of people move through one ground, and the camp still has no live picture of what's happening on it.

Visitors get lost

No reliable way to find a gate, the auditorium, the food court, or a restroom across grounds this large.

Drivers circle aimlessly

No visibility into which parking area still has space, so vehicles back up at the gates while other zones sit half empty.

Wardens coordinate by radio

Incidents and hazards get reported verbally, with no record of what happened, when, or who responded.

Camp administration flies blind

No real-time view of zone occupancy or warden deployment during peak congestion.

THE SOLUTION

One app, four people it serves

SCMS connects what's happening on the ground to everyone who needs to know it, in real time.

VISITOR

Opens an anonymous map and finds their way from gate to auditorium to food court to restroom. No login at all.

DRIVER

Sees live status of every parking zone and gets routed to whichever one is actually open.

WARDEN

Updates a zone's status in one tap, broadcasts alerts, and logs incidents straight from their phone.

CAMP ADMIN

Watches warden deployment and zone occupancy across the whole camp, live, during peak events.

Built on a real-time backbone

1

Live campus map

Zones, gates, and landmarks served straight from the database, no hardcoded assets in the app.

2

Parking that updates itself

A warden marks a zone full, and every driver's map recolors within seconds over a live socket connection.

3

Alerts and incidents, logged

Broadcasts and incident reports are timestamped and pushed instantly, replacing word-of-mouth radio calls.

4

Nearest-zone recommendation

A distance and occupancy heuristic ranks parking zones for a driver, so they're not guessing where to go.

NOT GENERIC

Modeled on the camp's real layout

Every zone, gate, and landmark in SCMS already matches a real place at Redemption City.

Parking zones

Main Car Park, Guest House Parking, Arena Overflow Parking

Venue ground

Holy Ghost Auditorium Grounds

Gates

Main Entrance Gate, Eastern Exit Gate, VIP Gate

Landmarks

Holy Ghost Auditorium, Redemption City Medical Centre, Camp Food Court, Admin Secretariat

What changes on the ground

TODAY AT REDEMPTION CITY	WITH SCMS
Wardens coordinate by radio, with no record of incidents	Incidents and alerts are logged, timestamped, and broadcast instantly
No visitor-facing digital map of the camp	A live, anonymous map covering real zones, gates, and landmarks
No visibility into parking occupancy	Drivers see live zone status and get routed automatically
Generic maps only show the camp's general location	SCMS understands the camp's actual internal layout

Built for one customer, on purpose

SCMS isn't a multi-tenant SaaS pitch. It's commissioned directly by RCCG as the operating body of Redemption City.

Direct commission

A one-time build and handover, or an ongoing hosting and maintenance retainer tied to the camp's event calendar.

Optional data insights

Anonymized occupancy and crowd-flow reports per event, to inform the camp's own future infrastructure decisions.

Proven before it scales

If this proves out at Redemption City, the same approach could extend to other RCCG provincial camps later.

No privacy cost

Visitors never hold an account, so there's nothing personal to protect or monetize.

From pilot to permanent fixture

PHASE 1

Pilot

Deploy on the existing seeded zones and gates during a regular service. Validate with a handful of wardens.

PHASE 2

Flagship event

Roll out camp-wide for a major gathering like the Holy Ghost Congress, full deployment, live for attendees.

PHASE 3

Standing tool

SCMS becomes Redemption City's permanent operations layer for every event going forward.

THE TEAM

Who built this

PA

Praise Adebayo

Backend Engineer

Authentication, account management, and the campus map data backbone.

OA

Olamidipupo Agboola

System Architect

System design, parking and alerts logic, recommendation engine, and the live socket layer.

OA

Olorunfunminiye Akinlua

Frontend Engineer

The mobile experience for visitors, drivers, wardens, and camp admin.

SCMS

A real-time mobility and safety layer for Redemption City, built on the camp's actual zones, gates, and landmarks, ready to pilot at the next event.
